Introduction and Sean's Background

Through. Hi, this is Risa Lakhani from the Doctor Polycom team, and I'm here today with Mr. Sean, Dylan, and, Sean is a p emf practitioner for more than a decade now, in British Columbia, Canada.

And, he's been working with Magnetic Fields to help people for that time. And Sean story is very interesting because he comes from a background of initially using pmfs to help individuals, with particular issues and has since then more recently become involved with exposing PMS to practitioners and helping folks that want to use it in a more clinical setting to help individuals.

So, now, he's more of a teacher to other practitioners. And so, Sean, thank you very much for joining us for this interview. This going to be an awesome talk.

And, I'd love to have you go ahead and, tell us more about yourself and how you got started with all this. Yeah. Awesome. Yeah. Thanks for having I'm excited and honored to have been invited to this panel.

Yeah. Time came to me through my family. My aunt and, my mother, kind of brought it into our family and our household and, just the advantage of fate, I guess.

My mom was in our end at the time. She did triage in the emergency ward in a busy hospital. So we I was fortunate enough to watch both of them, help, people here heal themselves.

But with my mom's, experience on the medical side of things, we, had, good. I guess a good teacher of, like, what medicine is, what disease is, what the symptoms are, what organs those are all related to.

So I had a good, like, a a good influencer of of the anatomy of disease and the human body. And then, just through my understanding of science and physics at that time, I was able to, implement and use with that knowledge.

So that's kind of how I was able to gain my, my knowledge base. And, now I just rely on the experience, just the time that I've put in, with individuals, and helping them change their, their situations.

Very cool. Okay. So, it's not very often that I hear somebody learned about PMS therapy through a parent. Do you recall how your mother was exposed to this and how she learned about it at all?

Yeah. My it came through my ad, so her sister and it was just it's a long story, but, just great coincidences. She was, caretaking for a family friend who was ill, and, he had a stroke, and they were able to bring in a hyperbaric chamber into his house and noticed, great gains.

And so, of course, that, piqued her curiosity, and she, went to, Southmead, meeting down in the States years ago.

How Sean's Family Discovered PEMF

And that's when she found the family 120 and was able to bring that back, to help, that family member, our family friend, here and of course, you know, the results are instantly noticeable so that my mom was able to get one, right away.

And then, yeah, that that merger, that fusion of knowledge, kind of came, came to me in my home. So, that's very interesting. So the PM 420. So that would be a high intensity PMS device.

And I think a lot of folks initially learned about EMF therapy by being exposed to more low intensity devices. So, sounds like from the get go, you were exposed to more of the, the therapy and the results with the high intensity

machine.

And yeah, it was, doctor Paula talks a lot about how intensity matters with PMF therapy. And so that's, a big variable with how, these, devices can help people.

Yeah. So could could you tell me a little bit about how you view PMF therapy as being beneficial for people? Yes. So I view it and I explain it as natural supplementation.

Our Earth has a natural magnetic field around it. And because of the vanity of humanity, we don't sense it. We don't. We can't see it. We can't touch it.

We don't feel it. We don't smell it. You don't go outside and be like, oh, well, the magnetic fields from the north today, right? We don't view it as weather.

So unfortunately it's out of sight and out of mind. But, there's three main aspects to Earth's magnetic field that we humans are no longer a part of and or pay attention to.

One being is that it is a very powerful force. So, you know, you can see that in the use of a compass, right? You don't have to put a battery in a compass for it to work.

And so every, every compass on this planet, thousands and thousands of little pieces of metal of pounds are being moved 24 seven by this force. And then again, going back to our compasses, they show us that Earth's magnetic field is everywhere all the time.

All right. You bring the compass inside, it works. You bring it on the mountain and cave down to South America. Earth's magnetic field is everywhere. All the time, just like areas.

But the third and most important aspect is that it's posing that a very specific and unchanging frequency. And that's where pump therapy comes, to importance for humanity is that there is a baseline, a natural element out there.

We live on a generator. Our Earth pulses at 7.83Hz, and that's what every device is mimicking. And that's what makes it natural. Supplementation is that we have to bring that natural element that we're no longer a part of into our homes and into our lifestyles.

And then that's how I view, time therapy is that it's supplementation of. Yeah. I think that that's a very great point. You know, we've certainly lost our ability to be in contact with this natural magnetic field, whether it's because we are in buildings most of the day or we wear shoes and don't have that direct contact with the Earth.

PEMF as Natural Magnetic Supplementation

Or our cars are, you know, using rubber tires. And so we lose that connection and that groundedness. And so that's one of the marvels of PM, of therapy to me, is that we can actually replicate fine tune and then deliver this to ourselves using technology.

Exactly. And that's where the high intensity comes in, as I relate it a lot to people, we understand we have to replace vitamins and minerals because our farming practices are keeping our foods healthy.

So everyone understands that you have to add minerals, magnesium, zinc and everything. So just like food, supplementation, it depends on your health goal, whether you want to do it naturally and just eat an organic carrot a day, or if you want to wait till you get sick and then take high doses of vitamin C.

So that's kind of where the spectrum of these technologies, come in. And that's what I like to guide people, into their venture, into pamphlets establishing what their goal is and then suggesting how to add that to their lifestyle.

And again, that's exactly why there's such a spectrum of devices, as it's just based on your goal and how fast you

want these results to occur. Right, right.

And so, with, in your experience, what are some of the, interesting cases that you've come across or some of the maybe, you know, the something that stands out to you in terms of an interesting story of patient recovery or along those lines?

Well, unfortunately, I become a little, stagnant to the amazing miracles that I get to see every hour. I'm definitely desensitized. I expect results every time, especially with high intensity machines.

But of course, you know, the the trendy diseases are are, are all reversed or are all reversible. So, to answer that question, I'd say just to blow people's minds or to, to excite people about it is, cancer is a really, easy one is a very, very responsive, disease.

And by the time the human body develops a tumor or other forms of cancer, it's in such dire need that any introduction of a of a field, really turns them around.

And then I'd say my next, disease, you know, I call them diseases, but is arthritis or any pain management anything that is inflammation based? You know, is a really quick turnaround.

To avoid any of the symptoms that they're, they're experiencing. Yeah. So, so that's interesting. So, you know, there's that common thread of inflammation, but there's also another common thread that these are chronic conditions.

And so, how many of us, how many people do we know that have all kinds of various chronic conditions and, may have had to resort to medication and or surgeries and procedures, which often have more detrimental effects.

So then it kind of continues to draw down on that person's reserves. And, so there's hope for these chronic conditions where we can introduce a positive stimulus.

And, you know, I've seen some, some of the cases, in my own clinic and with working with Doctor Paula, folks that have had various kinds of cancers, some of them even late stage, and many folks respond well, when we start to do the PMF therapy.

And I think a big part of that is the fact that it helps to create and sustain a more oxygen rich environment in the body. So you're providing the stimulation that allows for the terrain to improve, and then you can better be equipped to deal with, with the inflammation, with, the problems and the symptoms that occur with the disease process.

So that's really interesting. Yeah. So the end, the way I like, like placebos, obviously. A part of it, a part of healing, you know, science has been having a double test placebo for a while, so that's what I do, with my clients.

One on one is I'd like to explain to them and change their paradigm of what disease is. So if we speak quickly about all our trendy diseases that we have in humanity, and I'll just quickly read a look at some of, you know, some of the Chinese ones we I see at work is, you know, cancer, arthritis, diabetes, obesity, injuries or lack of ability to recover fully from injuries or surgeries that are necessary.

You know, we've got psoriasis, insomnia, balding, aging cavities, the list goes on and on and on and on. So what I like to explain to everybody is just to help their placebo, change and to give them the confidence that they can heal themselves within these fields is that there's three things that we have in common, within these trendy diseases is one being that they are global epidemics.

So there's not too many human cultures left out on this planet that aren't dealing with any or all of these problems. And the second and most important aspect of these diseases is that they are all 100% non contagious.

Yeah. Right. You can't catch cancer from someone you know keep the grandkids away from grandma because they're going to catch arthritis. Right. You've never had to put on a mask or gloves to be someone or be near

someone with psoriasis.

So what. That makes me think as well.

Chronic Disease, Inflammation, and Hope

How do all of these diseases become global epidemics when we're not passing them on to each other? And then the third aspect they have all have in common is that there's 8.4 million other species on this planet that aren't demonstrating any of our problems.

Right. Giraffes have the longest sea spines in the world, and they don't develop osteoporosis. They don't show signs of pain, with arthritis. They don't age to the point like humans do, where they're incapable of bending over and drinking their own water.

Right. Hummingbirds drink our sugar all day, every day, and they're not obese, right? And they're not diabetic. They don't get cavities. They don't have tea.

That was a joke. But. Right. So if you list all of human diseases that are non contagious, it's way bigger than the contagious, column. And none of those non contagious problems are exhibited in 8.4 million other species that live right outside that window of ours.

So when once people understand that they developed this problem, they're not a victim to a viral bacteria or a bacterial attack, then they have the understanding and comfort dence that these fields are going to release that potential that are within their cellular functions, and then they can heal themselves.

And that's what I love about my job as a therapist, is that I'm I'm able to bring people hope. And that is exactly why medicine fails. Everybody is because you can't cure something that's not a sick an illness.

And that's why there are no cures for anything chronic cancer, arthritis, diabetes, psoriasis, simple things like pain. There's no cure because everybody's looking at it the wrong way.

Medicine came to a high point when humanity was dealing with viral and bacterial infections, right. Like when we developed, steroids or antibiotics. Right. Those were plagues and leprosy.

Those are terrible things. And medicine's like, hey, look, we got this little white pill and it works for everybody. And they're still in that paradigm.

They're still looking for that great white pill that's going to change everything. But everything humans are dealing with are no longer diseases. They're poor cellular functions because we live in a poor environment.

And that's where hemp comes in, and is able to help everything is that if you look again, if you look outside 8.4 million other species, prevention is the best medicine.

Those animals are living in the proper environment in order for their cellular functions to be operating at their full potential, and they're staying healthy.

And that's the best way to deal with illness, is just not to get sick. And which is harder now than ever, it seems, and ever. And that's, that's another thing that animals are not doing right.

They still walk on the planet barefoot, they sleep on the planet, and they eat food directly from the planet. So they're showing us what life looks like.

And that. 7.83 herd environment. And another thing that they're not doing that we are is that they they're not changing their magnetic environment through electronic equipment.

And just like you said, that's why it's harder and harder for us to filter and stay in this proper environment is because we become dependent on electronic equipment.

And I love my electronic equipment. I love my fridge, I love my freezer, I love, you know, using the phone as a great tool of information. I'm not willing to give that up.

I'm not willing to turn my lights off, just like 7 billion people are not. So we have to start the conversation of how do we filter this invisible environment, and how do we supplement it in order to allow these bodies to thrive and stay healthy?

Instead of treating, chronic symptoms? Yeah, it almost seems like the convenience, has sort of taken the precedence over everything. And so we are using our capabilities to make life as easy and convenient as possible in the short term.

But then, yeah, excess in the long term. And that's what allows, I think, a lot of these chronic diseases processes to build. And of course, we don't always notice things in the beginning, you know, we that often it will take a symptom or, we often get good at ignoring symptoms.

So then it takes that barrage of symptoms for us to finally realize. Whoa. Hold on something. Something's not right here. And it's not like you said something you can take a pill for or, get a prescription for it.

You actually have to make changes. And so a lot of that is of course, is action taking. But PMF therapy, I think is a very easy to integrate way to help support that.

Well, it's easy and it's the most fundamental. Right. Like it. That's the only thing that we're doing different than 8.4 million other species. You know humans are love numbers and they love stats and percentiles and stuff.

And if you think about it, where the only sick animals are 8.4 million, we should be looking outside and asking ourselves these questions like, why isn't the squirrel limping?

Like, why doesn't that tree have disease? Look at it live so long it thrives right till the day it dies. And it's kind of confusing to me that humans haven't turned, to to those questions yet, especially if they're in pain every day or not getting to sleep every night.

Like, I'd be asking a lot more questions. Why those pills and those those procedures aren't working for me? This reminds me a lot of some of my training in acupuncture, where a lot of the, you know, the techniques and the treatments that come out of the world of acupuncture are because of the observations of how men exist in nature and when things are balanced in nature, when we're getting enough movement and enough air and exercise and the proper nutrients, it doesn't allow for an environment where disease can be, you know, become established.

And so we have it's almost like we knew this a long time ago, and we have unlearned it somehow. And now we need to relearn. Exactly. Yeah, but but, it's so fascinating, though, that PMF therapy can kind of be that blend in.

We are still leveraging technology, but we're wanting to help it deliver some of the benefits of nature. And, you know, it also helps that a lot of times you can just kind of lay down and do this PMF therapy and maybe get some meditation or get some relaxation.

You know, chronic stress is has ever since I was a child has been known as the invisible killer. And that hasn't really changed much. And PMF therapy in the way that it's delivered to the body can help to reduce that stress response.

And so, you know, I really one of the things I've appreciated about it, and why I love it so much, is because it does so many things in the body, for the body.

But, that's because it's working at the cellular level. So it affects all tissues. Exactly. And that's what's different

about other therapies is that they work on systems.

Right. Acupuncture works on the nervous system. Senses work on muscle systems. Chiropractors work on the vertebrae. What we get to do with the with Pam is that all those systems are built of cells.

So we're we're affecting and directing the, the structures that build these systems for us. And that's why it's able to deal with everything. Again, we're going back to that.

Prevention's the best medicine. Our DNA already has all of the information in order to keep these bodies perfect. And again, just comes down to environmental pressures and, and again, that's what's different than us and these other animals as humans is that our environments are extremely stressful.

Placebo, Environment, and the Houseplant Analogy

Whether it's stress about money, about, you know, what the news is telling you, what the bad news is telling you. Yeah. The way the MPs around us are emitting and the way I relate that to people and get them to change their mind, again, about disease, change that placebo, change that paradigm of why they are ill is, is a host plant, right?

We know that we've taken that that plant out in nature. So we know we have to recreate its happy environment. We have to find the right spot in the room where it likes, it gets in the sun too much or not enough.

We have to make sure it has the right minerals in the soil. You know, you don't. You can overwater it underwater it. And once you learn what environment that plant likes, it thrives.

And so this is where the human human aspect of disease is, is within and is within. This example is if you take this houseplant that is now thriving and you put it in the closet and you open that closet five days later, what's happening to that plant.

Right. Yeah. It's dying. But does that mean that plant is sick. No that plant is not sick in the closet. It did not catch a disease. It is just an environment that's not allowing it to thrive.

So if we're like oh sorry little plant. You don't like it in the closet right. I'm acting dumb obviously. And then we take it back out and we put it back in the spot in the room where we knew it thrive.

What happens to that plant five days after you move it back into that right environment? Right. It starts to heal itself. But does that mean you cured it?

No, you did not cure it because it was not sick. And that's why medicine is failing. Humanity is because they're looking at everything as a sickness, and that's why nothing's being cured as it has nothing to do with an illness.

It has everything to do with your environment. And that's again, where Pam comes in, is where we're surrounding those cells in the proper environment to allow them to heal themselves and thrive.

And just like a plant based on the DNA that's in those individual cells, that's what gives it its individual look. It's individual flowers, it's color of the leaves and what environment it needs.

And fortunately, like you said, science knows what the human body needs now. And that's where these devices come in, is that we're able to use this technology, replicate and amplify the environment that allows the cellular landscape to thrive.

So every time I look at a human who is sick, especially with a non contagious disease, I just look at them like a plant in the closet and I'm just like, okay, what do they need?

What cells in particular need an environmental change in order to catch up with the tasks that it's not doing in the stressful environment that humans live in?

Whether we talk about the EMF, the emotional, stresses and that that we live in, that's the closet that we're putting ourselves in. And that's how those changes and that's what we rely on.

Again, it comes down to that DNA programing. Everything's already within us. And these pulsing magnetic fields allows that to be released. That that's so empowering.

You know, I wish that we had more medical professionals thinking and speaking like this, because as you mentioned, not only does it give hope, but it actually empowers the patient to know that something can be done, that more can be done.

I think I might have to, use that line about thinking of my own patients as just being in the closet. And let's bring them out of the closet and put them in the right place where they can thrive, because it's certainly possible.

And you and I have both seen it and read about it and, observed it ourselves, where, people and even the most dire of situations have the possibility and the potential to improve and feel better.

Yeah. And you don't have to be a scientist or a doctor to, to understand it. With that analogy, everyone knows that when you put a plant in the closet, it dies and it's not sick.

Yeah. Exactly. Exactly. And and, had somebody not known that it had just been in the closet, they might look at it and think that it's sick, but that still doesn't mean that it is.

And so exactly going about the wrong way, then, you may not be able to, to, make a change. So, you mentioned several times about prevention being the best medicine.

And of course, you know, we know that concept well, I like to use PMS therapy frequently on myself. I try to do it daily, but sometimes that doesn't always work out.

But several times a week I am doing PMF therapy on my cell preventatively without working on a specific issue or problem. Is that something that you also do in your own life?

100%? And that's where are these different when people hear low and high intensity, devices, that's kind of where it what I like to see is me guide people into is understanding how to apply it to their lifestyle.

So, just and again, we're just mimicking nature. So we speak of magnetic strengths and Gauss. And just to give everyone a baseline, Earth's natural magnetic field is emitting about 0.5 gauss.

You know, I have to understand what that means. That just basically means the size of the magnetic measurements. So just like any natural supplement, if you introduce it to yourself naturally, that's the best way.

So Earth's magnetic field is emitting its magnetic field 24 over seven. So the best way to add it to your lifestyle is to be 24 seven. But of course, we don't want to live like that.

You'd have to go out into the forest and live in a cage. So I personally use, flax balls. It's it's the it's the best one to add to the lifestyle in order to mimic nature.

It's the only portable one. And its intensity is low enough so you can be on it all the time. So you can literally put it on your belt. You can go to the bank, go on a car trip in there, you know, go to work, sit on it.

So that's the best way to introduce pants is mimicking nature. There's a saying in the plant world, low and slow, our time is your intensity, right? So that's kind of that's this perspective.

That's the baseline. And then just like I mentioned before, adding minerals or vitamins, most people wait till they get sick before they add vitamin C to their life.

And that's why we have those nice little emergency packages or the, you know, people to just chewing on chewables all day when they get sick. So that's where the high intensity camp comes in.

And that's why I use the 10.20 as people lead a lifestyle that got them sick, and now they need a high dose to change that situation around. So yeah, I'm fortunate enough to that in my practice, I work four days a week, so I'm near that high intensity all the time.

But, my wife and I still do sleep every night. With the flex falls on, I call it the Nature channel. Emit 7.83Hz. So we're tricking our bodies into thinking that we're living like the 8.4 million other species.

Preventive Use and Daily PEMF Routines

So we're we just keep it on really low. But for that eight hour span, we're allowing our body, like, like you mentioned, to relax, to get into that natural environment and do its natural functions.

So that's how I use it in, in my lifestyle. Personally. Okay. So, the flex pulse is also a device that I like a lot, and I use it with myself and with patients.

And, the portable nature of it makes it very versatile. So you can apply it to different areas of the body or particularly the brain. You know, a lot of times we'll use it for treating the head and the brain.

And, also, the other thing that's very versatile about it is the various programs. So you can certainly use the 7.8, which is wonderful, but you can also use other settings on it to tune the brain to become more focused.

If you need to work on a particular task, or, if somebody is dealing with insomnia, you can use it to help relax the brain and go into delta, wave production so you can encourage deep rest or put the brain into a state of wanting to be in deep rest.

So I think the slides pulse is a magnificent device. In that regard, it's very cool. Okay. Now, do you ever do any full body EMF on yourself? Yeah. The PowerPoint 20 has, has a full body mat.

And that's if I do. I've had time off, recently, so I'm not in my practice all the time. So when I do use the high intensity at home, I use, mainly the full body mat.

It just, creates a bigger field and gets more of my cells. Activate it. Fortunately, I don't even know what pain is anymore. I'm a very active person.

So I don't have to focus on my body parts, so. Yeah, again, that low and slow, getting all those cells that make those systems up, going active, is, is how I use it personally, the most but yeah, if I do, you know, throw my back out or twist the knee or whatever, I'm able to use the attachments and focus, directly on those body parts.

And how did you make the decision to, transition from working more hands on with patients and, clients to then, working more with practitioners and helping them get set up with, with PMF therapy?

What's, sparked that change? Again, empowerment. Just giving people the power. I've always, been an entrepreneur. I've never worked a 9 to 5. I don't like a man.

I don't like being told where I like. And that's, again, part of my environmental change is I want to lead my life. And that's what I love given to people is this.

It's it's this package of self-employment where they can be their own bosses, make their own times and have the confidence of everybody wants to help everybody.

So it just gives them the, the ability to instantly help, their neighbors. Well, first of all, and they help their family, friends, neighbors, towns. And again, the way I understand have been I've been able to briefly explain it that, you

know, nature has a team environment, and you look outside and every other animal is okay.

So that has led me to believe and understand that have is for every human and I don't know every human. And I also don't have time to treat every human.

So that's where, where I like to set up these businesses is to make high intensity more available to people and normalize it and get this conversation going.

So I like to train, my time therapist, with these analogies that two of these analogies that I've, that I've shared. And again, it just changes that placebo.

It's a game of telephone. The message will just spread and spread through the 7 million people that live here. And eventually it will be normalized. And people of all people will benefit from the knowledge that we are sick because of our environment.

And this is that filter. It is that environmental change to and pain and non contagious disease. Yeah. So it's all about making more impact. It sounds like yeah I I'm motivated to it's hard to have this knowledge and have these experiences behind private doors and not want to go up to strangers in the grocery store, shake them and be like, hey, I can help you.

You just need this. That's all you need. So I have that. I can totally relate. Like, I have a clinic that I'm actually speaking to you from, and we have a nice window out in the front that we can see the parking lot.

And I can't tell you how many times I see somebody walking with a limp or, you know, I see somebody who looks like they could benefit. And, you know, I almost have to tell myself, like it up, you know, not the appropriate time to, to approach and whatnot, but, it's it's so exciting.

You know, we have, you know, like, I've certainly thought about this, but I've never put it in spoken words the way you did. But yes, this literally can help every human.

It's for every human. And and the, the traditional contraindications, you know, even the, the we used to not be able to use it with people with pacemakers or other implanted electronics.

And now even that's changing. Now a lot of those devices are becoming compatible to be able to use with magnetic fields. So it's so exciting that, previous limitations, are gradually, reducing one by one.

Teaching Practitioners and Expanding Access

Yeah. And yeah. And again, it just comes down to that, that supplementation magnetic fields are the second most important element to life on this planet.

And that this is what leads me to believe in and understanding that it is for everyone. And, you know, we know we've been taught that er, is the most important, right?

The human body can't go more than 30s or a minute and a half without it before damage occurs. But then red hot water is the next most important. But we know that the human body can go five days, six, seven days without water before damage starts and then fire.

Earth or food is the next most important, but it's common knowledge that we could easily go 30 days without food. So, where magnetic fields comes in as is, this is the second most important element.

And, you know, these invisible, you know, the things that are working behind the scenes that we're not aware of can actually be harnessed to, to help us heal and recover from modern day problems that we've created for ourselves.

Yeah. You know, this lack of healthy environment, good terrain, lack of connection with nature, even lack of, communication with ourselves. You know, we're in an increasingly isolated world, and we have our own magnetic fields, and, and when they can be close together, we can reap some benefit from that.

And we're missing out on that, too. So it's it's such an exciting time to, you know, take this PMF therapy and educate the public about how they can use it for themselves.

Like you said, you don't have to be anybody special or fancy or a doctor. Anyone can use this stuff. We just need to spread awareness and learn about it and educate.

So, you know, thank you for doing all the work that you do in that regard. And, you know, we got to keep getting that message out there. You know, you probably you might even know this, but Tony Robbins just, published a new book.

And in it there's a section on PMF therapy. And so I think that's all the more sort of signal that the time is right now for the public to really learn here about this.

I still run into many people who have never even heard about PMF therapy, and it's exciting to educate them about it, but it's going to be even more exciting when people are like, oh yeah, I know exactly what you're talking about.

And, yeah, I've tried that before. I know somebody who's done that. Yeah, just has to become common knowledge. Right? Again, like I said, that window, it's harmonized is perfect and it's disease and pain for, you know, you've given me some really interesting concepts to really ponder about.

Even though I've been working with PMF therapy for the past 4 or 5 years, these are some really new and interesting ways to, to think about this. So, you know, thanks very much for, for sharing that way of, of contextual sizing, all this.

Yeah, that that's my pleasure. I'm glad I was given this microphone. So, before we close, are there any other, you know, things you'd like to mention about PMF therapy or the work that you do or, anything else?

That's on your mind? Yeah. Well, no, just reiterate that, you know, for lack of a better word, God's given you everything inside those cells. You are powerful enough to change your situation.

You're not a, a victim of anything that you're dealing with right now, and, Yeah. And and you, even if you are a victim, you know, suppose you suffer an injury or suppose, something happens to you, that, you know, is not, because of the environment or the terrain.

You can still use this stuff to help you. It'll stay that way faster because it'll work on improving those cells. Exactly. Everything. It's innately inside you. It's just magnetic field cells use magnetic fields to communicate and function.

And that's how this releases that potential. From within. Yeah. Yeah. Well, thank you very much. Again, it was such a pleasure to to talk with you and learn some new ways to think about some of these things.

And thanks again for all the work that you do. And, we'll hopefully keep spreading all this, the lovely messaging about all this.
