Step-by-Step Guide: How to Reconstitute Peptides with Bacteriostatic Transcript

(Transcripts are generated by AI and may contain errors)

Peptide Reconstitution Setup

All right. So let's say you bought peptide and it has to be reconstituted. This is a five milligram size and here's some reconstitution fluid. And this is what we're going to do.

Take the top off. The top was already taken off. I keep this in the fridge. You'll use this for many reconstitutions, right? This will fill many, many vials, all right.

So I usually use a hundred on this one. so I'm gonna reconstitute almost everything. Let me tell you, you'll have instructions on what you're gonna do.

you will know for your specific experiment, but I am gonna put a 100 units into this and then the dosing will be based upon that and the calculator that we're going to use, but this is how you actually do it.

Amount of air for the pressure. We're gonna go back in that little tiny, there's a whole circle within the circle. See that? Yeah, that's gonna be the area.

That's right. It's 90 degrees. Go. You don't want to bend that needle. All right, the same thing. I'm just going to gently move it and you'll see like it becoming this cloudy fluid.

So that your general reconstitution on how you do it.
