Introduction and urgency around cancer

Was an absolute honor and pleasure. Doctor Edward Group with me today. Thank you so much for for spending some time with me. Hey. Thank you. I mean, right.

You know what the world is like right now with the transhumanism agenda and the turbo cancers. So it couldn't be better timing to get as much information out to the world as possible so people can regenerate.

People can work on their body, their mind, their so, and transform to the next higher level. Yeah. I mean, there's so much fear out there and there's so many I mean, so many exposures to things.

And then also, obviously we just came out that Covid era where things really seem to take a turn for the worse in regards to cancer and especially, you know, the turbo cancers.

Have we seen the last few years? I mean, it's really I mean, this this is something that we need to lean in on and get the best minds. Yeah. On track to kind of figure out what what do we got to do.

So doctor group, I mean, you've been in this space for a long time. I mean, in your mind, how would you describe cancer? Yes, as a matter of fact, I started in an alternative oncology research group in 1994.

People have been around longer than me, but our group was very special because we got access to a lot of different things. We got to spend time with all of Royal Raymond Rif stuff, which I ended up inheriting his all of his lab manuals, etc.

we got to travel around the world and meet with doctors that were doing even back in the 90s. Remember that in the 90s there was no internet. It's so easy now.

You can just go type in, you know, natural forms of cancer. But back then it was a very underground thing. As a matter of fact, doctors were getting killed off if they were having good success rates with cancer.

And so we had to travel around and look at everything, you know, we were people were doing crazy stuff, injecting, you know, urine. And even though that was very effective, by the way, but just it was an experimental phase.

But it was also a very powerful phase in the cancer realm. Ultimately, all of the cancer doctors, and I think everybody would still agree today that the root cause of cancer is a toxic external environment and a toxic internal environment.

Root causes of cancer and early clinic success

It's really that simple. It's it's a poisoning of of inside your body, your mind and your soul, and it's a poisoning that you're exposed to on the outside.

And this this goes back to the epigenetic research and Bruce Lipton, etc., etc.. So if we understand and we know that not only cancer, by the way, heart disease, any, any accumulated disease is nothing more than a toxicity within the body and a toxicity outside of the body.

What do I mean by outside of the body? Well, are you sleeping on memory foam mattresses in your bedroom or are you using toxic personal care products?

What is the air quality in your home? Are you exposed to toxic chemicals or contaminants at work? All of these things accumulate in the body and can turn on different diseases, or can turn on cancer, etc..

Now, I would say that we were really effective back in the 90s and 2000. We opened our cancer clinic in 1998, in Houston, Texas, and it didn't take. But about two years before, we were just slam packed with with everybody.

And we we had great success rates. The reason why we had such good success rates, I believe, is that we were addressing the four components that the medical system never addressed.

Number one, gut number two, liver number three, parasites, and number four, chemicals and heavy metals. Now, what has always been the most challenging part of treating cancer?

From an standpoint, it's always been the epigenetic factor that the body has called MDR multidrug resistance, which means cancer. The pumps on the cancer cells, well, well, not the cancer cells will come become accustomed to whatever you are trying to kill them with, and they will develop a resistance just like your normal cells.

So that was always challenging about being able to change up the cancer, whatever you're using naturally, because there's really three ways that you can.

If you're diagnosed with cancer, there's only three ways that you can. Well, I guess four ways you can either do nothing. You could do the natural route, you could do the allopathic route, or you can do a complementary route, which would be a combination of both.

What we've seen change recently is since Covid, when we had bioweapon shots developed. Now the body could not recognize, attack and eliminate cancer cells as efficiently as before.

So now we're even seeing a higher rate. I mean, we should in the natural realm. It's just instead of calling it multidrug resistance, we should call it multi herb resistance or something.

Because we're not seeing we're what we what we've seen since Covid is it's a lot harder. It's getting a lot harder with natural therapies to be able to get the body's natural immunity up to where it can attack cancer cells and get the compounds that we want to get into the cancer cell, into the cancer cells.

So that's why a good percentage of my research has been focused on lipid nanoparticle technology. Now, that sounds weird, right? Because that's in 2016 when Big Pharma changed their name from Big pharma to biotech biology, run by technology.

Most people don't understand that. But this is the main goal of you can call them Luciferian, as you can call them the globalists. You could call them the people that run the world, the secret societies, etc.

the thing is, they always come out and tell you what they're going to do before they do it. And you've seen Ray Kurzweil and you've seen Klaus when he was head of the World Economic Forum, and you've seen all of these Bill gates and everybody come out in our face and say, quote, we want to convert the human race from a carbon based, God based system to a silica based transhuman system, in other words, a cyborg.

That's what their plan is.

FDA raid and pressure on alternative oncology

And they're doing that through. I mean, not only do they want to genetically modified humans, but they've already genetically modified pretty much all the agriculture genetically modified the air that we're breathing, genetically modified the water.

Now, why is that important with cancers? Because this is what initiates this is the toxicity that initiates the cancer and many other diseases. So I can say this if you if you understand that all diseases and is is caused by a toxic

external and internal environment, then what's your approach?

You clean that, you clean that environment. And so I think one of the things that made us a lot more successful, which, by the way, we were raided by the FDA in 2002, I was almost thrown in jail and our cancer clinic was shut down.

And we could never see cancer patients or open up another cancer patient again. So that actually made me even more resilient and motivated to to dig deeper and then start developing products and then start working more behind the scenes on different types of cancer research and different types of cancer protocols.

So, so sensually. I mean, because you were effective, because you were turning things around, they went after you and shut it down because obviously, like you said, this, this a biotech and all the powers that be that that drives that industry, they don't like that competition.

They, they want to make sure that their agenda is fulfilled. And obviously, what we're talking about on this kind of a summit are tools that we can utilize to minimize the dependency on that technology.

And so they they shut you down essentially for being effective. Yeah, they shut me down. They I had death threats. They followed me around in black cars for a while.

They actually picked me up in a black car, pulled up and said, get in, we need to talk to you. And I didn't have a choice. I mean, I you know, I didn't have anywhere to go. So I got in.

They took me to this old Chinese restaurant in Houston, and I got I walk in there and I'm looking at all of a sudden I see all the pictures of presidents and and famous people on the wall.

And I'm like, who would come to this little tiny Chinese restaurant as a dignitary? And then they take me back by the kitchen and the wall opens up, and then they bring me into this little room and the wall closes, and they tried to get me on their side.

They said, we want you to work on a in a think tank with us, because I had a lot of that's a whole other story about some of the things that I did when I was a kid, when I was blessed with these visions of stuff.

Post-COVID turbo cancers and delivery challenges

And we want you on board with us. We want you in this think tank. Here's a number to call, and you have 24 hours to call this number. If you don't, you you'll be taken care of.

You'll have unlimited amounts of money. You'll you'll be protected. But you have 24 hours to call this number. And I said, and then, you know, I left.

And of course, I went home. I told my wife about it, and I took a lighter and I just burned that number. And that was it. Of course, I've heard from him all times.

The FDA still, you know, follows me and they they come in about once a year, once every couple of years just to check and see what we're doing. But nowadays it's so much easier because the levels of censorship have been lifted.

You know, we there's not just a group of ten people talking about this anymore, like the whole world's talking about this now. So it's not their overwhelmed.

They're at a state where there's really it's too much for them to handle at this point in time. As far as since Covid, with the with the turbo cancers.

To get back to the story about what I think is one of the most crucial things to think about right now in this age of

turbo cancers is, you know, I'm in contact, you know, I know what you're doing through Judy and everybody else, and you guys are doing amazing, amazing work.

Thank you for everything that you're doing. But the one thing that we're the request that I've had is to develop something that is a that can bypass the multi-drug resistance pathways of cancer.

And because people I mean, I know people that are on all kinds of natural things right now and the cancer is having difficulty, you know, getting it in.

It's the gut, it's the pathways. It's that the resistance of the cancer cells to suck those those compounds in, to kill them. So I've got a proprietary formula that goes back to in 2000 and around 2016 to 2018, when we started seeing so much shift from capsules into injections or even in capsules with Big Pharma, with the lipid nanoparticle technology, just everything was going nano, nano, nano.

But then you look at the I'm sitting in meditation one morning and I'm like, and I see this picture of the nutraceutical natural industry. And I'm saying what has changed and what has advanced in our industry in the last 200 years?

We're still using capsules, we're still using tinctures. And here Big Pharma is already doing lipid nanoparticle. They could do it as delivery systems that can do it as monitoring systems.

They're using all they have a medical band area network set up a wide body area network. They can read what's going I mean like crazy stuff. But that's also part of the control system.

So I said there's in order to attack or neutralize lipid, there's always a good and a positive. I mean, there's always a good and a negative in everything, right?

This is the physical world that we live in. There's there's positive and there's negative of everything. So if there's positive I mean there's negative being bad nanotech then where is the positive.

Well, so I started saying how can we mimic the natural process of the body when a body, when the body takes in an organic mineral or vitamin and processes that all the way through to a subatomic particle.

Okay. So there's people out there going, oh no, no, no, no, nano is bad. Nano is about your body. Naturally, if you have the mechanisms working, which nobody does, can't does break down everything to even beyond nano to subatomic if your liver is functioning correctly, if you have enough hydrochloric acid in your stomach, if your microbiome is functioning correctly, I mean, there's a lot of ifs there, right?

So I said, what about it? How could I do that? How can I take a lay a troll, for example? Or how could I take a vitamin C? Or how can I do take anything for that matter glutathione NAC?

And this would be the equivalent of an IV strength, right? Because you wouldn't, you would bypass it would go everywhere in the body, and it would be highly absorbed by any abnormal cell.

But you have to be able to break through the MDR pathway. This is a recent development, by the way. What I'm telling you just happened in the last 3 or 4 months.

We finally figured out a way to create a microcosm, which is all natural. I don't use any heat. I don't know, like if you come to our facility, you'll see all glass vessels.

You'll see there's no chemicals, nothing. So in order to mimic the body, what goes on in the body? Right. Sound, vibration, light and energy. How do you break all that down? You.

Lipid nanoparticles and transhumanism concerns

Your body does it through sound, vibration, light. You sound is vibration. But basically it's it's energy. So we had to

do that using sound, using light, using vibration to be able to mimic and create a nano sized microphone with a delivery system.

How do you just because you have a delivery system doesn't mean it's going to be delivered right? How do you bypass the MDR pathways to multidrug resistant pathways of cancer cells?

Well guess what. There's there's a proprietary formula that I developed that does just that. It actually bypasses the pathways. And the two of the ingredients that we found that that has that have been studied that do that.

I'm not I can't give away all the ingredients, but you'll know pretty soon is a specific combination of trans and acid. The those are two components that have been studied to take care of the MDR pathways.

Because it opens up, it prevents the p glycoprotein. It's basically a p glycoprotein inhibitor, which means that it doesn't allow the cancer cells, the membranes, to actively push out those compounds because they've developed resistance to it.

That's kind of a easy way to explain that. So now this is a huge discovery because now with it I don't have this manufactured yet, but we can create this which can be used or combined with any type of natural cancer therapy.

And you don't have to worry about it not being not working anymore, because as soon as the cancer cell detects it, it just pushes it right back out or it prevents it from coming in in the first place.

And then so one of the issues, you know, with the light bulb categories are, you know, like you're talking about, you know, I hear you have them noninterest that the majority of the liposomes out there, they're so huge.

And so for them to be able to then move into the cells is quite challenging. So here you have a non and you know liposomal a type of delivery system that is extremely unique.

And then you're them bringing in frequency medicine to it. So they are then charged with this energy assay. Then enter into the body. And then you also add that layer of overcoming the eMDR or MH multi or resistance.

So you're you're kind of solving all these issues that we've been doing with the formulations that you're currently doing. And like you mentioning you, you're bringing that with like little and with vitamin C.

I mean we all know how important vitamin C is, but is it getting into the cells? Are we just keeping it out? I mean, what what is happening. So be able to can I get that orally to the same kind of concentration as you potentially would do as an IV?

And I mean that to me that is that's phenomenal. Yeah, we've already proven that actually we've done studies with the high dose vitamin C that we're creating right now.

The mic resemble and you're right. So as I started looking into this about seven years ago about how to create something that the body could use that would be in a nano form, but not negative nano positive nano, and something that was going to be absorbed as something that could be utilized very efficiently.

I started looking at all the liposomal supplements that were on the market. Second thing I something was wrong with that. I just wasn't it wasn't. They were in capsule form and different things.

I was like, how is that? There's there's no claims on their websites about the nanometer size or anything. So I start calling the companies and then I find out that none of them were even actually liposomal.

You're allowed to put liposomal on the label if you put some of the fossil lipid in there. So they were using sunflower lecithin, or they were putting some phospholipid on there and then just calling it liposomal, it was ridiculous.

They didn't even have any tests or research behind it. So when I started digging deep, I was looking beyond

liposomal because we wanted to get into the one nanometer range if possible.

Bypassing multidrug resistance with new formulations

And I found these old studies done by the cosmetic industry. And they were they were creating what they were calling glycerol zones, and the glycerin zones were made.

They were using glycerin for that, but they were taking it to a very it was a chemical process and it was a heat process, and it was an ultrasonic process which the ultrasonic processes can.

I tried all that again. I've tried everything. But what happens with the ultrasonic processes is it creates titanium nanoparticles in the product, because you have to use a titanium horn in the ultrasonic system, and you definitely don't want titanium in your nano nano titanium to be ingesting.

So what they did, it was so effective, by the way, because the cosmetic industry was was they were also looking at drug delivery through the skin. Right.

And not only that, they were looking for anti-aging stuff and everything, but it was so powerful that they when they did the studies on the rats, the rats actually died because it just went straight into their bloodstream.

They had, you know, it's all chemicals. I mean, the cosmetic industry, it's all cancer causing chemicals. And then they just they asked the studies after that.

They were like, whoa, this is just too powerful. And I came across that. I was like, how can we make a formula doing everything naturally and doing it?

Mike resemble I actually came up with the word Microsoft that didn't exist, but it's a way to describe a glycerin at the process that we've created, which is the Microsoft process.

And you can now we're switching all of our supplements over to Mike resemble. And we already have a lot of them already. But the vitamin C that we created is 10,000mg per tablespoon of Mike.

And when we went when we sent it to the clinical trial facility, they first of all, they couldn't even go up that high on a lot of people with IV vitamin C in one day.

And the IV vitamin C has preservatives in it too, that people can get sick from. And also it was the IV vitamin C what? It's really hard on the kidneys and it was eliminated.

Even the higher amounts 10 to 15,000 20,000mg was eliminated by the kidneys. In six hours it was gone. It was gone from the body hours, which was 10,000mg per tablespoon.

The IV version. There were still traces of it in the body 72 hours after administration. So it was getting in everywhere. It was getting into the cells and it was just as effective.

So now we have the ability to not only with anything and a C glutathione on any of the the, which is a product we've been working on, which is Judy's product.

I know you're aware of that. She worked on that at the end. I h you know, back in the days with Doctor Fauci, what we're trying to do now is help as many cancer doctors as we can by giving them these high end products to where even they can even work with individuals via zoom.

Right now, we need as many cancer doctors out there as possible, teaching people, even if they can't come in to their clinic and be seen, they can still consult with them and they can still have the product shipped to them, and they can still have a coach or whatever go through it with them and they can take them.

Of course, we always it's always best to be in the clinic if, if possible. But this is a huge, huge thing that we're dealing with. And not only that, we're going to be adding the multi herb resistant proprietary blend of these things as well.

So we'll be able to bypass that with the cancer cells and be able to hopefully ultimately save millions of lives. That's what it's all about right? That's what you do every single day.

And giving people hope, taking away the fear and and saving lives. Yeah I mean that that oncogenes blend. I mean we I know the amount of effort and the amount of resources that have been allocated in order to be able to get this into kind of that manufacturing process, you know, to find the right sources, make sure they're clean enough, and then also, obviously the delivery system and then also now adding that layer of eliminating cancers ability that to spit it out that that chemotaxis where it's just getting out, whatever it is that you're trying to feed it.

And so to me, it's going to be so exciting when we have all these components together, the oncogenic. So you get the, you know, the oral IV, vitamin C, I'm not sure what the product is called yet.

I know it's been kind of played around with a little bit. And then also you have the B17 and that that phenomenal delivery system. And we know B17, you know, delivers that that that cyanide molecule, you know into the cancer cell.

Microsizing nutrients and vitamin C delivery

Because the cancer cell then has a specific enzyme that that opens up that cage, you know, so we can increase the delivery of that into the cancer cells.

So bringing these components together in addition, like what you're saying, you know, it's still got to work on the gut. Still got to work on the liver.

Still got to clear out parasite. You know still gotta make sure we clean out our environment and internal environments bringing all these components together.

I mean, I, I'm so excited to see what that next level is going to look like. Well, the same thing is actually let's I'm glad you brought up the liver.

This. So what what the all the doctors in the 90s. Well, we only had our clinic for four years, but then I've still been working with all, you know, as many cancer doctors as possible, and they usually call me whenever they have an issue.

And I try to learn from them. Like, I want to learn as much as possible about what's currently going on. Because I lost both of my parents to cancer when I was young.

And so it's been a it's been a mission of mine. It's like, you know, it's it's kind of it's something I really enjoy because it's the hardest part of natural medicine.

You could take anybody with diabetes or heart disease or, you know, ALS or miss or whatever, and if they do what you say, you can get rid of everything.

Cancer is a whole in a whole nother realm. It's not it's not as easy as people think it is in the natural field to to just say, here, take this B17, your cancer is going to go away, take the Cybermen and your cancer is going to go away.

Take this fen, then your cancer is going to go away. And I do believe that one of the things like when the doctors call me and they say, hey, I've got this cancer patient, you know, I'm doing all this stuff.

Tried everything. I've tried chlorine dioxide, I've tried black sap, I've tried, you know, name it all these different anti parasitical and nothing seems to be working.

I always go back and ask them one question. How many liver cleanses have you done on this patient. And then usually they'll say, well, I haven't really done any liver cleanses.

I had a case. This is this is this, you know, how God brings things to you and, and and you just it's like an moment where you really you might not think something is effective, but then all of a sudden God just shows you how effective it is.

I get a call one day and this guy is explaining to me. He said, I just want to thank you. And I said, thank me for what he said I had for stage cancer.

I had cancer all over my body. I was sent home to die. And I was praying to God, praying, praying. And all of a sudden your website came up and I just kept getting this voice in my head from God that said, live or clean your liver.

And so I went on your website and I called. He called our customer service. He said, can you federal express me three liver cleanses overnight? And they said, yes, we can do that.

So he said, I started on your I was given two weeks to live. I was not. They told me I wouldn't survive more than 14 days. Your liver cleanse takes six days to do.

I did your first liver cleanse and I was still alive after the seven days. Then I did the second liver cleanse, and I was still alive after 14 days, and I didn't.

And and the only thing I did was your liver cleanse, because I already had ordered. Then I ordered 4 or 5 more liver cleanses. And so he did the third liver cleanse.

And now he was still alive after 21 days. And he said, the moral of the story is, I did 28 of your liver cleanses back to back, which was what, like seven months, right?

And he goes and and I went back in last week to the doctor's office and all my cancer's gone. And that was an moment for me. On how important the liver actually is.

And so many times people come in to practitioners offices regardless of what condition they have, whether it's fibromyalgia or whatever, whatever it is.

And then they're evaluated and then sent out the door with a bunch of supplements, and they're not addressing the gut cleaning and healing, the gut cleaning and healing the liver, cleaning all the parasites out of the body, and cleaning all the chemicals and heavy metals out of the body.

See all the schools, whether it's chiropractic, naturopathy, medical schools, whatever they teach Symptomology you this is, find out what your patients symptoms are and then give them a drug or an herb or whatever.

Like even in that your school chiropractic college when you go out, instead of having all the big pharma companies there, you have all the nutrition companies there and they're like, hey, your patient comes in with a headache.

Look, look on page 62 here, page 62, give them magnesium, give them calcium. Give them this, give them this, give them this. You you just.

Liver cleansing as the foundation of healing

Here's your prescription manual right here. But nobody was asking. Well, what is the root cause of the headache? What is the root cause of the patient's condition?

And that that bothered me. So we did a test with 100 people. This was back in the year 2000 while we had our cancer clinic going on. Because we're taught a patient comes in, do a history, take a bunch of labs, get some blood

work here in your analysis, run all the labs, and then that's going to tell you exactly what's wrong with the patient.

Okay, I got my labs back. I see deficiency in the thyroid, the kidneys off, the ratios off. I've got, you know, calcium deficiency. I've got magnesium deficiency.

Okay, I'm gonna put them on a kidney supplement, put them on a thyroid supplement. I'm going to put them on calcium, magnesium, whatever my philosophy was.

What if this was my question before the city? What if we address. What if that issue is being caused by gut liver parasites and chemicals and heavy metals?

So what if I was to take two groups of people, or just take one group and run them through, take all their labs, run them, then run them through a six day gut cleanse, six day liver cleanse?

Parasite cleanse is normally six weeks, but we just did like a two week parasite cleanse. And then having them sweat and doing a chemical and heavy metal cleanse for about a week.

A very simple like I'm talking very simple plants. We did that. We reran the tests and about 88% of those original symptoms that were on all those labs were gone. Or it was like peeling an onion.

The real issue started popping up. I've been telling people for years, if you go in and do doctor tells you have thyroid issues, it's not your thyroid, it's your liver.

If you go in and your doctor tells you you have heart issues, it's not your heart, it's your liver. If you go, if you go in, your doctor tells you have any organ issue.

It's your liver. Nothing. Nothing happens in your body until your liver falls below 20 to 30% functionality. Why do you think the medical profession knows this, by the way?

That's why they never developed any tests for the liver. You really think that you can you can tell what's going on with the liver with alt a GSGOT. The liver has over 500 functions.

Not only does it regulate your hormones, your thyroid, your breaks down your nutrients, your proteins, communicates with all your other organs, detoxify.

What we've seen since Covid is we've seen a massive amount of fungus and yeast and mold in the liver, which are all parasites. And now we've had now we have synthetic parasites.

I personally believe with all of my cancer research for 30 plus 30 plus years, the night, I would say 96 to 97% of all cancers, probably 100% are parasitical in nature.

When we were reviewing Royal Raymond Rice research, he. He also claimed that the Royal Raymond Rife had a destructive approach. Right. There was there was Lacasse and right.

Those were the two scientists that were getting the highest success rates with cancer. He had the multi wave oscillator, right, had the frequency device, rice frequency device was made.

He had had these quartz glass tubes blown almost in the shape of an egg. This is why no one's been able to replicate right. Success because no one has the right is using the right stuff.

It wasn't just about tuning frequency, and it was about generating a scalar quantum level frequency along with that. And in order to do that, you'd have to have stolid platinum electrodes.

You have to have helium gas, only you can't have a LED glass tube with argon and neon in it, like some of these ripe machines do. Okay, so you have lead in your glass and you're putting frequencies through it.

No. Right. What happened with right with John train came in. They were they they started they started drinking a lot. Crane was a bad influence on rife.

When rife died, Crane took all of his stuff. Rife only had 28 frequencies. Okay. He didn't have a book of 10,000 frequencies. Rife never had frequencies for the liver and frequencies for the adrenals and all these other frequencies for cold and flu and none of that stuff.

I have his lab manual. His lab manual. I have him I donate to Steve Ross, the World Research Foundation. But I can tell you right. Did not have a lot of frequencies.

There was 28 roughly plus or minus five frequencies that he used on everything. Crane wanted to when rife died, wanted to expand this whole thing and create this, you know, machine that could be used for everything, whether it was an eye float or frequency or whether it was fungus or whatever.

It's bogus. None of that was ever developed by. Right. But the point I'm trying to make with parasites here is something that is not talked about a lot.

It's something that, right in his later research, was coming to recognize, even though he had a light microscope that could view 100,000 x living organisms, he said he had it in his notes.

There are worlds beyond worlds, beyond worlds of organisms that I have not yet been able to see or identify. So think about that for a second. We don't know how deep this goes.

We don't know the level of worlds beyond world to parasites and organisms that are existing that haven't even been defined, found. We don't know what I believe is some of these organisms now are being activated by this nanotechnology, by this transhumanism agenda.

And that's why it's so important to be able to have a broad spectrum anti parasitical program of using, you know, 4 or 5 anti not only, you know when I say anti parasitical I'm really talking about mold fungus, worms, bacteria, you know any harmful organism that it's living inside somebody that needs to be eliminated and released from the body.

So by so back to the cancer protocol. Yes. Like when I advise any cancer doctor I'm like you need to be having your patients through one six day liver cleanse every single week.

And then you work as you're working. They need to be sweating every day hopefully for 20 minutes a day, because sweating is going to be pushing out all of those chemicals, all of those toxins.

They need to be cleaning and healing their gut. Which is why we developed the ultimate probiotic and the oxy powder, which, by the way, oxy powder was Tesla's original gut cleansing product.

When we were on the Tesla research team, Tesla was Tesla's fast, was fascinated with health. A lot of people just think he was associated with electronics and electricity.

Parasites, fungi, and broad-spectrum cleansing

But towards the end of his life, if you read the book The Wall of Light by Arthur Matthews, Arthur Matthews was Tesla's understudy, came to Tesla when he was 16 years old, tells the stories of how the spaceship would land in the desert, and Tesla and Arthur would get on and they would go to Venus like, you know, they had a communication with the Venusians.

It's pretty wild. But he had a vision towards the end of his life that all disease is going to start in the gut, does the poisoning comes through your mouth and the poisoning comes in through the gut, the majority of it.

But then all health begins in the gut, in the gut to the poisoning that Tesla. So before Tesla died, he said, what can I do? What can I develop to develop something that's going to clean and heal the gut?

It's not going to be like herbs like psyllium and cascara and senna and stuff that will harm the gut over a period of time, but something that would be beneficial for the microbes and everything else.

And he met with a guy named Eugene Bloss in 1898, and they developed this product called Oxy powder, or back then it was just an ozone rated magnesium compound.

The only reason he chose to use magnesium oxide is because if you look at the lattice, the matrix of the magnesium oxide molecule, he didn't want it, wanted to be a magnesium supplement.

He wanted it to use as a delivery system that he could find the reactive oxygen species to almost like ozone in a way. Right? Because you're able to a reactive oxygen species would be an oh one or an oh three and above.

Oh two is stable, right? It's oxygen, but oh, but a reactive is that's what you want, right? You want to be able to react with a positively charged parasite toxin.

Whatever. Whatever whatever. So he worked on this product and was able to stabilize a lot of reactive oxygen species onto the magnesium oxide molecule.

So when you take it in the acid in your stomach, it slowly releases into your body and cleans. And the way that it cleans the gut is through an oxidation reduction reaction, which means it's going to take all the solid matter and convert it to a liquid or a gas.

Just like just like you put hydrogen peroxide on it, earwax or something. And it's going to it's going to melt it away. So anyway, getting back to the cancer now because of because we're in this post Covid era, because we're in this transhumanism agenda era, not only do we have to be concerned about parasites and everything, but we also have to be concerned about the nanotechnology that's being sprayed everywhere and work with that as well, and protect the cells and eliminate that nanotechnology.

So what I'm recommending to cancer doctors, and we're working feverishly right now to try to get all this stuff out there. I've got a you talked about the ancient times.

Well, like Kellogg, for example, back when he had the largest natural healing facility in Michigan and many healers, many, many, many healers in the past would use sunlight and photodynamic therapy.

So what we're doing is we're taking right now I've got a photo dynamic product coming out specifically where we've taken all of the colors of the plant porphyrins, and we've mixed them into a mike resemble photodynamic, a liquid to where you take a tablespoon of this, it goes in its mike resemble it goes into every cell, and then you expose the patient to sunlight or to red light or yellow light or whatever kind of light therapy that you want to expose them to.

And then that activates all of that inside. So that so for what I'm viewing as the next generation of not only cancer care, but since we're talking about cancer, is using the IV strength photodynamic in conjunction with light therapy, using the the microphone will be 17 using the high dose micro vitamin C, using the micro oncogenes, using a combination of all the anti parasitic.

Whether you're a fan of Viber and then dissolve all of the different anti parasitic, we have a micro pair tracks two, which of course has the black walnut, the wormwood, the club and all the the high end anti parasitic in there I developed the black seed oil black seed.

The black seed oil we have is a microcosm of black seed oil. And because of the research that we pulled, which I talked about at the healing for the ages conference regarding the genetically modified E.coli and the genetically modified yeast that the transhumanism people are using with the past stories and the P service and the C service, a yeast, the brewers yeast, I put the cinnamon bark all in with the black seed because the cinnamon bark will work on the, especially the genetically modified yeast.

And we got to clean this yeast out of the lever. Multiple liver cleanses, getting rid of all the chemicals and heavy

metals, getting rid of the parasites.

And of course, you know, working with the emotional component of that individual and working them through their healing process. But it's it's extremely important to make.

And there's obviously there's many other things out there too, like ozone saunas and hyperbaric. I mean, the list goes on and on. There's no shortage of natural cancer therapies, that's for sure.

But but being able to not overwhelm the individual patient and being able to just choose the really good ones is very important. And that's also have really good success with the lateral flora, which is the lateral flora.

What is kind of like an IRA then. But it's really a taxi coli in yeast.

Photodynamic therapy and advanced cancer protocols

It was founded by a scientist in Iceland back in the 80s, and everybody in the cancer industry used it in the in the 90s and in the early 2000 because it's really, really good as an anti East product and it really helps heal the bow as well.

But bowel health is very important. And of course diet except that's kind of my take. I also love DMSO, a chlorine dioxide. I was the first person to work with Jim Humble on chlorine dioxide.

I was in the first documentary film. What most people don't know is chlorine dioxide was has been used for quite some time. We were using it. It was used in the 70s and 80.

All the cancer doctors pretty much in the 90s. We're using it, but it wasn't called mEMS. There were two companies back then that were competing with each other.

One of them was called halos and the other company was called oxy 100. That was the EMS of the 90s. And those people had research on that dating back into the 80s then.

But they they were keeping it low. It was a very, you know, like I said, there was no internet. As a matter of fact, I was the first person to put EMS online.

And that's the second time I got rated by the FDA. And then I was told I can never sell EMS ever again or chlorine dioxide ever again. So that was the first.

We were the first website to ever push put mess up, which was the Miracle Mineral Supplement with Jim Humble. So there's a lot of there's a lot of things out there that are that are working, you know, really well.

And obviously you're one of the top cancer doctors in the world, and you're doing so much good with people and getting people better. So thank you. Thank you.

And that that's the thing is that, you know, I think as we are moving forward in understanding new things, a lot of times we then tend to forget the foundation that we built that worked in the past.

And so and that is, as always, been my, my challenge that we, you know, people as people, we get so excited about new shiny things and then forget about, you know, like you're saying the the liver cleanse, how powerful that is.

And that the gut supporting cleaning out old matter in the gut, utilizing magnesium oxide to help to dissolve all that Clark and stuff that that that's going on in the gut that really allows these the mold and parasites and bacteria to exist within the layers of all, all that hardened gunk that's in intestinal tract.

And and like with a lever, it is. So when people then do labs, they check for Alt and AST. And if they get really

advanced I'll check for GTT as well.

And essentially these are late stages tests. You know, when it start to show up in that area, then the liver has been struggling for a long, long, long time.

So you cannot look at these blood tests and say, well, the labs look good and I'm fine and I don't need to do anything. You know, if you live on planet Earth, you've been exposed and you need to clean it out.

It's absolutely that. I mean, just make one more comment, if you don't mind, on the liver. So there's I, I don't think there's anyone in the world that has as much research on the liver as we do, because we've done 3 million liver cleanses, over 3 million liver cleanses since the 2000, and our liver cleanse was we used to work with the Clark and the Gershwins and everybody back then we was it was a small family, right?

It was only like 60 advanced alternative oncologist in in 1990. I mean, they were getting killed off to those doctor hit in Mexico. Some of them are still around doctor Yemenis and doctor Cowden Lee Cowden.

And I don't know where you were back then, but talking about the liver. So we've been able to evaluate it now with AI, we can actually put all of these success stories in everything from all of these, this documentation for the liver.

And we did that a couple of years ago. And what I the conclusion that was spit out or that we that we came to is right. And I would say this with 100% accuracy right now, probably 100%.

There's a few, let's just say 99.8% of the people that are living on the planet right now, their liver is only functioning at a maximum of 20%. Think about when you think about the amount of yeast, the amount of stones, the amount of flukes, the amount of sugar people consume, the amount of toxins people consume, the energy drinks, the alcohol, alcohol, the bread deliver is.

It's unbelievable. If you think about the the amount of damage that the liver can take every single day and still deliver regenerates itself every 90 days, it is.

I've had so many cases of people that just done liver cleansing and all their diseases and all their conditions have gone away. I'm trying to teach doctors how important a liver is because, you know, instead of addressing the thyroid or addressing all these other issues that are popping up, address the liver.

Once the liver is functioning, you will never get. If your liver is functioning above 80%, you will, I can almost say, never get any type of condition or any type of disease, including cancer, heart disease, nothing.

Okay. Now you say, well, how long does it take to clean the liver? And how long does it take to get the liver back above 80%? So what we've noticed through just anecdotal evidence, because the natural world is anecdotal, right?

I mean, there really is no such thing as clinical. Nobody in the natural world would just give somebody one thing anyway, right? So it's like everything works together in unison.

So it's really like anecdotal evidence of success with monitoring the amount of liver cleanses that we're doing with people. We've come to the conclusion that one six day liver cleanse will repair about 15% of your liver.

Liver regeneration, self-healing, and closing remarks

So assume that anybody that's suffering from any symptom, let's just assume your liver is functioning at 20%. Not not to mention the fact that you're seeing fatty liver and kidneys now.

And since Covid, fatty liver and liver disease is skyrocketed because of the nanotech, the liver doesn't know how to process it. But let's assume your liver is functioning at 20%.

One liver class is going to bring it to 35%, the next liver cleanse 50%, the next lever cleanse 65%, the next liver

class 85. So you most people are going to need a minimum of three, four, five, six.

Another thing we've noticed looking at Tesla how everything revolves. The Fibonacci, the three, six, nine, it seems like every on multiples of three, six and nine is when you really get a kick out.

So the third liver cleanse, the six liver cleanse, the ninth liver cleanse, the 12th liver cleanse. As those people are going through the process, they're they're building their liver back.

Once the liver is at 80% functionality. And you can also fast one day a week on water, you can also I'm a big proponent of urine therapy. That's a topic for a whole nother show.

But these are you know, that's where Brzezinski got your antineoplastic are developed, your body develops the anti-cancer agents. It needs to fight the cancer. And it's in your on your.

That's one of the other things I didn't add to the list of many for for cancer therapies or cancer treatment, but urine is at the top of the list of that.

So that's that's all of those taking all of those things into consideration. You can speed up the liver repairing itself by not eating as much, getting rid of the sugar, getting rid of the alcohol, all of the lifestyle changes that should be made anyway to get that that person's health, mind and body balanced so their self-healing mechanism can kick in.

All we do in natural medicine is teach you how to reactivate yourself. Healing mechanism. When your self-healing mechanism is clogged up, your self-healing mechanism is toxic.

It's overwhelmed you. You have a hard time healing. All we're doing is cleaning your body out. You need your mind out, cleaning your soul out, giving you the necessary things that you need to regenerate and reactivate your body.

Self-healing mechanisms. Yeah. Yeah, exactly. And at the end of the day, that that's exactly what it is that God given a healing. Yeah. Intelligence that exists within us, like you're saying in a layers upon layers.

I mean, I usually liken it to like a sliver. I mean, even in Nature Medicine, you have like you're saying you have this disease and that Earth, you know, versus, you know, pharmacology is this disease and that, that drug.

So we've moved away from looking at the root causes, underlying drivers. We're managing symptoms just like the sliver. You know we have that in there.

Obviously the best would be then to remove the interference remove that. But instead we're managing the symptoms. We're doing anti-inflammatories. We're doing anti infectious agents.

We doing pain medication. We're doing all these things to manage symptoms versus just removing this flavor. Yeah. And so and that's important that we get back to that mindset in regards to how we address the body and heal it.

So doctor Group thank you so much for being this voice of of power in this field and for really can I reiterating the foundational principles that still needed, you know, frequency liver and and then utilizing the tools the intelligence that exists within us.

And I'm so excited about this this new product line that's coming out that I think is going to be revolutionary for, for people going through and through cancer.

So thank you so much for everything you do. And I'll, I'll everyone listening. Check out Global Healing. It's a phenomenal phenomenal product line. And so thank you so much doctor Group.

Hey thank you I appreciate it. We all appreciate everything you're doing and all the time and effort you're putting into helping humanity every single day.

Thank you. Thank you. Ditto. Thank you.
