Vaccine Testing and Control Groups

Alright, listen to Dr. Simpson here. He never once talks about safety, he only talks efficacy. Vaccine people often say that these vaccines weren't tested against randomized control trials or control groups.

And that's false. All childhood vaccines that are out on the market today have been tested either against randomized control trials, placebo control tiles, or control groups.

So what does that mean? If you have a vaccine that is effective and you're bringing on a new vaccine, then you compare the two vaccines. Meaning you don't take the brand new vaccines and compare it against saline.

Why? Because you had one vaccine works and want to see if the next vaccine work better. And that's where the anti-vaxxers kind of get you. They say, well, that wasn't a placebo control.

It is unethical to do placebo-control in any medicine or any vaccine when you have a medicine, or a vaccine that works. So he's saying, if you had a new vaccine, then you compare it with the old vaccine.

But this new vaccines is a totally new drug, and they're now testing for safety by using a true placebo, such as saline.

Placebo Use and Safety Debate

Now you can have three old medications or vaccines, combine them into one shot, they still apply the same principles, it's unethical to test the new medication that has all three combined.

So this is the part that's been silent for many years. People don't talk about this. It's nuts that he's saying this on social media. He's say we don' test for safety, we only test efficacy.

it blows my mind that is actually saying it because this where you keep your patients ignorant And you threaten them and you say, hey, get these shots because your kids are going to get sick.

If you don't, you're going be a bad parent if you Don't get the shots. They use fear and ignorance to Get parents and the law mandates to So you will compare it against the vaccine.

Bottom line, when you hear these anti vaccine type say they haven't been tested, not only have they been testing and The efficacy has been test that according to major medical groups, But they also have continuous long-term testing going on.

So if there's an issue with the vaccine, they can come back and take a look at it.

Claims About Long-Term Monitoring

That's not going very well because epidemiological studies do not give us good truth and good quantity of truth. I've had a dozen kids in my practice over the years who were profoundly autistic within the day of getting a vaccine.

A dozen. Now, I've talked to medical doctors and I see them online saying, oh, this doesn't happen. No, it doesn' happen because the parent doesn''t take their kid back to see you.

Or they take the kid to back see and you ignore it and say it's normal or you say its working or some BS like that. We should all be very happy. Dr. Simpson, any medical doctor, Any parent, and any scientist should be happy that RFK Jr.

is bringing science back into this industry. You're testing these medications with a true placebo. If you don't use a placebo, you're manipulating science, You can't call it science.

It's no longer science and finally we're getting science into the industry
